Find Adjacent & Neighboring Polygons

Title Find Adjacent & Neighboring Polygons

Description

Find and make a list of 1st and 2nd order polygon neighbors.

Illustration

Summary

This toolbox contains two Python script tools. Both find and make a list of adjacent and neighboring polygons but work slightly differently.

Both lets users select an ID field, which could be numeric ID (i.e. 1, 2, 3, 4... or FID/OID) or text/string field (i.e. Chicago, Evanston, Skokie... or zipcodes, like 60201, 60202, 60203..).

- (1) **FANP Add Fields To Input Features**: stores a list of neighboring polygons in new fields. Works best for quick finding and to find 1^{st} order neighboring polygons only and probably not for a large dataset. It took about a day (23 hours to be more precise) to finish the job against the US 5-digit zipcode polygons (32,237 cases/input). Also, the major drawback of this tool is "data over flows" when the neighbor polygon ID list gets longer, the new text field may truncate the list due to the field size limitation (up to 254 characters)
- (2) **FANP Output Text Table Join**: does the same as (1) but will store the list in a separate text file (comma delimited table format). The user may want to check the last option box to join the output text file to the input polygon features. Since it's a text file, there shouldn't be no "data loss".

So, I probably recommend (2) **FANP Output Text Table Join** tool for the reason above.

Credits

The codes I looked at are by: ## Miles Hitchen (greatest, in VB, found in Forums.Esri.Com), ## Esri (CalcFields.py in ArcGIS Resource Center 10) ## Esri (SelectByNeighbours.py in ArcGIS Resource Center 10)

Notes:

Both tools come with Item Descriptions which you can view in ArcCatalog.

I also included a "test" polygon shapefile.

My codes are not perfect but I added as many comments as possible – hope they make sense. Let me know if you found anything. cmaene@gmail.com
